Calculation task № 23

Determine the liquid flow capacity of the vertical gravitational separator for the following data: the diameter of the separator is 2.8 m, the density of liquid is 845 kg/m^3 , the density of gas under conditions of separation is 26.5 kg/m^3 , the dynamic viscosity of liquid is 2.3 mPa·s, the estimated diameter of gas bubbles is 0.16 mm.

Data:

$$D_{S} = 2.8$$
 m

$$\rho_{g.s} = 26.5 \qquad \frac{kg}{m^3}$$

$$d_{g.b.} := 0.16 \cdot 10^{-3}$$
 m

$$\mu_L = 2.3$$
 mPa·s

$$\rho_{\rm L} = 845 \qquad \frac{\rm kg}{\rm m^3}$$

$$g := 9.81 \qquad \frac{m}{s^2}$$

Determine: Q_{L.v.s.} - ?

Solution

The liquid flow capacity of the vertical gravitational separator:

$$Q_{L.v.s.} = \frac{\pi \cdot D_s^2}{4} \cdot \frac{d_{g.b.}^2 \cdot (\rho_L - \rho_{g.s}) \cdot g}{18 \cdot \mu_L}$$
(1)

where D_s is diameter of the separator, m; ρ_L is density of liquid, kg/m³; $\rho_{g.s}$ is the density of gas under conditions of separation, kg/m³; μ_L is the dynamic viscosity of liquid, Pa·s; $d_{g.b.}$ is the estimated diameter of gas bubbles, m; $Q_{L.v.s.}$ is liquid flow capacity of the vertical gravitational separator, m³/s.

$$Q_{L.v.s.} = \underline{\qquad \qquad \qquad \frac{m^3}{s}} = \underline{\qquad \qquad \frac{m^3}{day}}$$

Answer:
$$\frac{m^3}{s} = \frac{m^3}{day}$$
